- 4 Summary

The Algorithm

- V_0 : A special node in the graph, e.g., the node with the smallest ID in the graph.
- $l(F)$: A leader of cluster F , e.g. the node with the smallest ID in the cluster.
- $g(e)$: A guardian node assigned to each minimum weight edge e .

Table of contents

 - Results
- 4 Summary

The Model

- Nodes are considered as processes which are wired together using One2OneChannels
- Channels communication is synchronous.

Table of contents

- 1 Introduction
 - The Algorithm
 - Algorithm Framework
 - **Dead Lock**
- 2 The Implementation
 - Communication Channels
 - Parallelism
- 3 Model Checking
 - Testing
 - Results
- 4 Summary

Dead Lock

- Two processes executing a receive (read) command and waiting the other process to send (write)
- Both processes will be locked
- A single process can either send or receive but not both
- Each node has two processes running in parallel

Table of contents

- 4 Summary

Communication Channels

```
final One2OneChannel[] inputOutputChannels =  
Channel.createOne2One(totalNumberOfChannel);
```

- 4 Summary

Parallelism

```

Parallel par = new Parallel();
CSPProcess[] activeProcesses = new CSPProcess[] {
    new Parallel(ActiveSendingProcs),
    new Parallel(ActiveReceivingProcs)}
par = new Parallel(activeProcesses);
par.run ();
par.releaseAllThreads();
  
```

 - **Testing**
 - Results
- 4 Summary

Testing - Listeners

- No shared objects were used. Therefore, we do not need to check the implementation for Data Races
- Deadlocks.
- Unhandled Exception.

Testing - Assertion

- MST algorithm solves the problem in $O(\log \log n)$ communication rounds.
- Algorithm works in phases.
- Clusters have to grow faster by merging clusters.
- $\beta_{k+1} \geq \beta_k(\beta_k + 1)$, where β_k denotes the minimum cluster size in phase k .

```
assert(beta >= oldBeta * (oldBeta + 1));
```

JCSP Library

```
Parallel par = new Parallel(processArray);  
par.run ();  
par.releaseAllThreads();
```

Our Implementation - Trial 1 (Entire Algorithm)

- 2 nodes
- One edge
- 4 threads

```
Parallel par;  
CSPProcess[] activeProcesses = new CSPProcess[] {  
    new Parallel(ActiveSendingProcs),  
    new Parallel(ActiveReceivingProcs)}  
par = new Parallel(activeProcesses);  
par.run ();  
par.releaseAllThreads();
```

Our Implementation - Trial 1 (Entire Algorithm)

```
at org.jcsp.lang.Barrier.sync(Barrier.java:458)
at org.jcsp.lang.ParThread.run(ParThread.java:129)
```

```
===== results
error #1: gov.nasa.jpf.jvm.NotDeadlockedProperty "deadlock encountered:
thread index=0,name=main,s..."
```

Our Implementation - Trial 1 (Entire Algorithm)

- `CSPProcess[] activeProcesses = new CSPProcess[] {
 new Parallel(ActiveSendingProcs),
 new Parallel(ActiveReceivingProcs)}`
- `CSPProcess[] activeProcesses =
 getNodeProcessesArray(allSendProc,currentRecProc);`

```
par = new Parallel(activeProcesses);  
par.run ();  
par.releaseAllThreads();
```

Our Implementation - Trial 2 (Entire Algorithm)

[SEVERE] JPF out of memory

Summary

- Graph of size 2.
- Over than 38 million states, no error detected
- First 5 steps, no error detected
- Could not check the assertion
