#### EECS 3213 Fall 2014

# **L11: Line Coding**

## Sebastian Magierowski York University

EECS 3213, F14 L11: Line Coding 1

#### Overview

- · Line Coding
  - Techniques to represent bits launched into a baseband channel
  - A form of baseband "modulation"

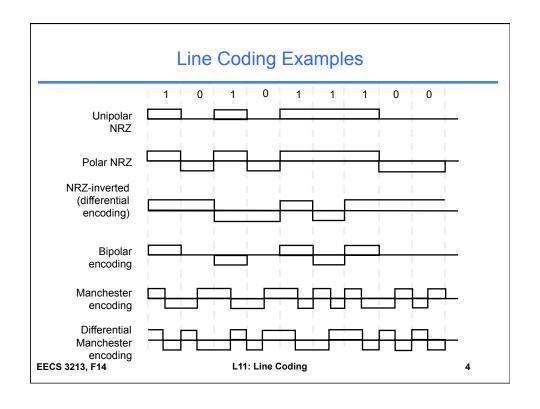

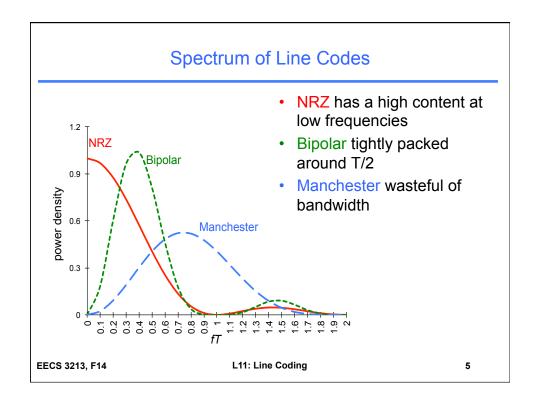

EECS 3213, F14 L11: Line Coding 2

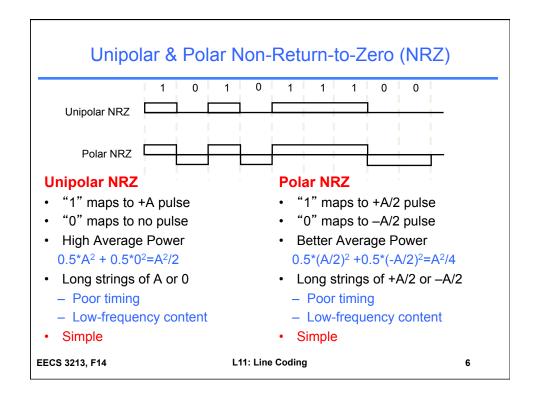

### What is Line Coding?

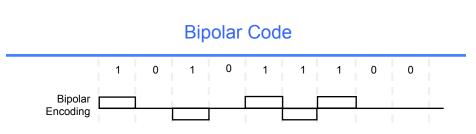

- Mapping of binary information sequence into the digital signal that enters the channel
  - Ex. "1" maps to +A square pulse; "0" to -A pulse
- Line code selected to meet system requirements:
  - Transmitted power: Power consumption = \$\$\$!
  - Bit timing: Transitions in signal help timing recovery
  - Bandwidth efficiency: Excessive transitions wastes bandwidth
  - Low frequency content: Some channels block low frequencies
    - long periods of +A or of –A causes signal to "droop"
    - · Waveform should not have low-frequency content
  - Error detection: Ability to detect errors helps
  - Complexity/cost: Is code implementable in chip at high speed?

EECS 3213, F14 L11: Line Coding 3

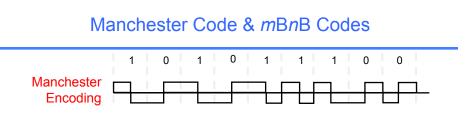

- Three signal levels: {-A, 0, +A}
- "1" maps to +A or –A in alternation
- "0" maps to no pulse
  - Every +pulse matched by –pulse so little content at low frequencies
- String of 1s produces a square wave
  - Spectrum centered at T/2
- Long string of 0's causes receiver to lose synch

EECS 3213, F14 L11: Line Coding 7

- "1" maps into A/2 first T/2, -A/2 last T/2
- "0" maps into -A/2 first *T*/2, A/2 last *T*/2
- Every interval has transition in middle
  - Timing recovery easy
  - Uses double the minimum bandwidth
- Simple to implement
- Used in 10-Mbps Ethernet

- mBnB line code
- Maps block of m bits into n bits
- Manchester code is 1B2B code
- 4B5B code used in FDDI LAN
- 8B10B code used in Gigabit Ethernet
- 64B66B code used in 10G Ethernet
