    Markov Algorithms
```

Determine what the following Markov algorithm does and explain why it does not double a string. What change(s) would it take to make it double a string?

```
\(\zeta \eta \beta \rightarrow \eta \beta \zeta \quad \zeta, \eta\) are members of the alphabet
    \(\alpha \zeta \rightarrow \quad \zeta \beta \zeta \alpha \quad \lambda\) represents the null symbol
        \(\beta \rightarrow \lambda \quad \alpha, \beta\) are markers
        \(\alpha \rightarrow \quad . \lambda\)
\(\lambda \rightarrow \alpha\)
```

The algorithm
$\mathrm{abc} \rightarrow \alpha \mathrm{abc} \rightarrow \mathrm{a} \beta \mathrm{a} \alpha \mathrm{bc} \rightarrow \mathrm{a} \beta \mathrm{ab} \beta \mathrm{b} \alpha \mathrm{c} \rightarrow \mathrm{a} \beta \mathrm{b} \beta \mathrm{ab} \alpha \mathrm{c} \rightarrow \mathrm{a} \beta \mathrm{b} \beta \mathrm{abc} \beta \mathrm{c} \alpha \rightarrow \mathrm{a} \beta \mathrm{b} \beta \mathrm{ac} \beta \mathrm{bc} \alpha \rightarrow \mathrm{a} \beta \mathrm{b} \beta \mathrm{c} \beta \mathrm{abc} \alpha \rightarrow$
$\mathrm{ab} \beta \mathrm{c} \beta \mathrm{abc} \alpha \rightarrow \mathrm{b} \beta \mathrm{ac} \beta \mathrm{abc} \alpha \rightarrow \mathrm{b} \beta \mathrm{c} \beta$ aabc $\alpha \rightarrow \mathrm{bc} \beta \mathrm{aabc} \alpha \rightarrow \mathrm{bcaabc} \alpha \rightarrow \mathrm{bcaabc}$

To double or duplicate the string use the following Markov algorithm

| $:$ [prod. schema] | $f \delta \beta \rightarrow$ | $\delta \beta f$ | $\delta, f$ are members of the alphabet |
| :--- | :--- | :--- | :--- |
| $:[$ prod. schema] | $\S f \rightarrow$ | $f \beta f \S$ |  |
| $:$ | $\beta$ | $\rightarrow$ | $\sigma$ |
| $:$ | $\sigma$ | $\rightarrow$ | $W$ |
| $5:$ | $\S$ | $\rightarrow$ | $\bullet W$ |
| $:$ | $W$ | $\rightarrow$ | $\S$ |

$\rightarrow($ by 2$) \mathrm{a} \sigma \mathrm{b} \boldsymbol{\beta} \mathrm{abc} \boldsymbol{\beta} \mathrm{c} \S \rightarrow(\mathrm{by} 1) \mathrm{a} \boldsymbol{\sigma} \mathrm{b} \boldsymbol{\beta} \mathrm{ac} \boldsymbol{\beta} \mathrm{bc} \S \rightarrow(\mathrm{by} 1) \mathrm{a} \boldsymbol{\sigma} \mathrm{b} \boldsymbol{\beta} c \boldsymbol{\beta} \mathrm{abc} \S \rightarrow(\mathrm{by} 3) \mathrm{a} \boldsymbol{\sigma} \mathrm{b} \boldsymbol{\sigma c} \boldsymbol{\beta} \mathrm{abc} \S$
$\rightarrow($ by 3$)$ a $\sigma$ bocoabc§ $\rightarrow($ by 4$)$ abocoabc§ $\rightarrow($ by 4$)$ abcoabc§ $\rightarrow($ by 4$)$ abcabc§ $\rightarrow($ by 5$)$ abcabc
Write a Markov algorithm to transform a binary number, e.g., " 101 " into a unary number represented as a series of tallies, e.g., "11111" that represents the binary number.

| 1. | $10 \rightarrow$ | 0 \| | | $0,1, I$ are members of the alphabet |
| :---: | :---: | :---: | :---: |
| 2. | $1 \rightarrow$ | ) I | $\lambda$ is the null symbol |
| 3. | $0 \rightarrow$ | $\lambda$ |  |
| input 101 | $\rightarrow$ | 0101 |  |
|  |  | 00\|l1 |  |
|  |  | 00\||10| |  |
|  |  | 0010III |  |
|  |  | 000\||IIII |  |
|  |  | 001\|III| |  |
|  |  | 0\|IIII |  |
|  |  | \|IIII |  |
